What have we done ?

- Observed occurrence: $P_i = \mathbb{P}(X_i)$

- Observed occurrence: $P_i = \mathbb{P}(X_i)$
- Observed co-occurrence: $P_{i,j} = \mathbb{P}(X_i, X_j)$

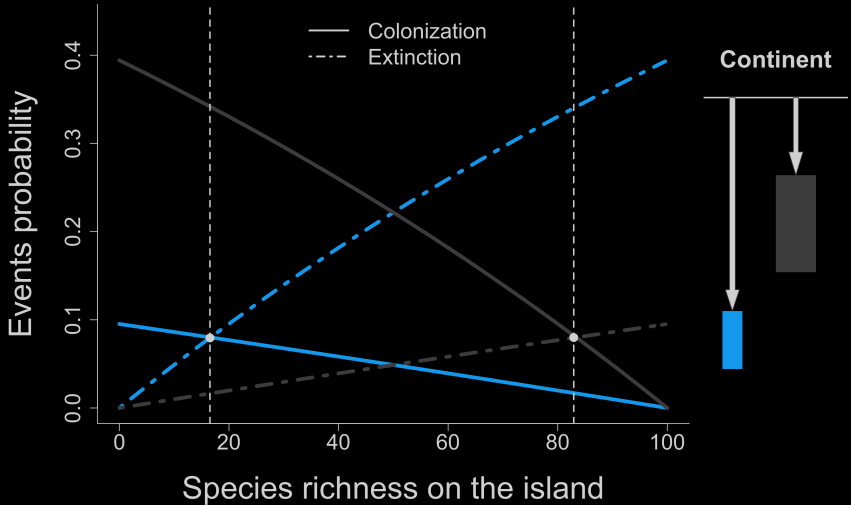

- Observed occurrence: $P_i = \mathbb{P}(X_i)$
- Observed co-occurrence: $P_{i,j} = \mathbb{P}(X_i, X_j)$
- Independent co-occurrence: $P_{i,j;IND} = P_i P_j$

- Observed occurrence: $P_i = \mathbb{P}(X_i)$
- Observed co-occurrence: $P_{i,j} = \mathbb{P}(X_i, X_j)$
- Independent co-occurrence: $P_{i,j;IND} = P_i P_j$
- $\frac{P_{i,j}}{P_i P_j}$ vs Network properties

- Niche Model to build realistic networks
(Williams and Martinez, 2000)

(Williams and Martinez, 2000)
- Trophic Theory of Island Biogeography as a theoretical distribution
(Gravel *et al.*, 2011)

Theory of Island Biogeography

Trophic Theory of Island Biogeography

Two additional rules:

- 1 Island without preys, predator cannot colonize

Trophic Theory of Island Biogeography

Two additional rules:

- 1 Island without preys, predator cannot colonize
- 2 Last preys goes extinct, predator goes extinct too

Do interacting species co-occur differently from not-interacting species?

Theoretically speaking YES

Do interacting species co-occur differently from not-interacting species?

Theoretically speaking YES

- 1 Direct and indirect interactions impact pairwise co-occurrence,

Do interacting species co-occur differently from not-interacting species?

Theoretically speaking YES

- 1 Direct and indirect interactions impact pairwise co-occurrence,
- 2 The strength of an association decreases with the length of the shortest path between two species

Do interacting species co-occur differently from not-interacting species?

Theoretically speaking YES

- 1 Direct and indirect interactions impact pairwise co-occurrence,
- 2 The strength of an association decreases with the length of the shortest path between two species
- 3 The strength of an association decreases with the number of interactions a species is experiencing

- Environmental gradients?

- Environmental gradients?

$$P_{i,j;IND} = P_i P_j$$

- Environmental gradients?

$$P_{i,j;IND} = P_i P_j$$

$$P_{i,j;ENV} = P_{i;ENV} P_{j;ENV}$$

- Environmental gradients?

$$P_{i,j;IND} = P_i P_j$$

$$P_{i,j;ENV} = P_{i;ENV} P_{j;ENV}$$

- Empirical data?

Empirical datasets

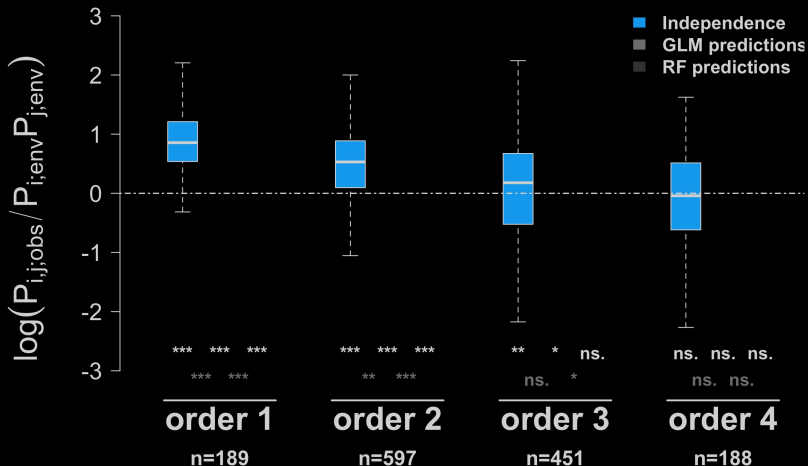

S: Salix

H: Herbivore

P: Parasitoid

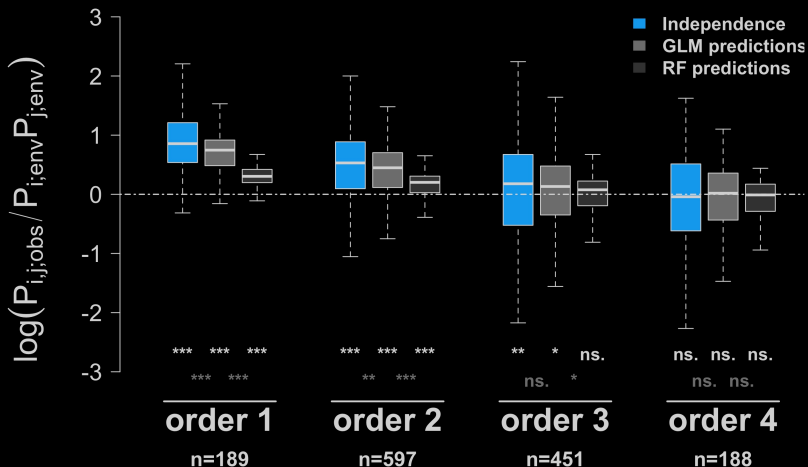

Empirical results

Do interacting species co-occur differently from not-interacting species?

Empirally speaking YES

- 1 Direct and indirect interactions impact pairwise co-occurrence,

Do interacting species co-occur differently from not-interacting species?

Empirally speaking YES

- 1 Direct and indirect interactions impact pairwise co-occurrence,
- 2 The strength of an association decreases with the length of the shortest path between two species

Do interacting species co-occur differently from not-interacting species?

Empirally speaking YES

- 1 Direct and indirect interactions impact pairwise co-occurrence,
- 2 The strength of an association decreases with the length of the shortest path between two species
- 3 The strength of an association decreases with the number of interactions a species is experiencing

Do interacting species co-occur differently from not-interacting species?

Empirally speaking YES

- 1 Direct and indirect interactions impact pairwise co-occurrence,
- 2 The strength of an association decreases with the length of the shortest path between two species
- 3 The strength of an association decreases with the number of interactions a species is experiencing
- 4 Taking the abiotic environment into account makes the signal is weaker

Perspectives

- Mutualism and predation induce positive co-occurrences
- What about competition?
- Can we really tease abiotic and biotic constraints apart?

Biogeography: integrated theory

1 Abiotic variables: λ ,

Biogeography: integrated theory
